# BRILAN MAXLINE

Video, LAN, IQ -  
Modular Systems

Slim, smooth profiles in the BRILAN model provide for high functionality in multi-display solutions like split walls.

Identical holding points for wall-mounting for all models and sizes up to 52"; optional MAX-Line wall mount, floor stand and MAXLine base.

OPEN MON - Click function modules corresponding to customer preference - can be easily replaced.

The Yemen chameleon, optimally adapted to its habitat, highly specialized and full of surprises. It holds much more than you would expect at first glance.

# MAXIMUM TOLERANCE - GREAT SUCCESS

Constant development, adaptation and specialization are tried-and-tested concepts for success based in nature. Every day brings exciting new projects – the **MAXLine series** has the right system.

**MAXLine BRILAN** is a modular system for large screens starting at 32". Each unit is made up of a display module and a function module. All BRILAN elements can be freely combined. The system features functions from the classical video monitor to various configurations for an ePC. All MAXLine displays up to 52" have the same dimensions for fastening holders for wall mounts. This ensures extra leeway and flexibility for our customers.

## BRILAN DISPLAYS

Extremely high quality display modules

BRILAN display modules are available in the following sizes: 32", 40", 46", 65" and 70".

Our panels are a guarantee for high quality and a long service life. The DID displays are industrial panels with high brightness and an extremely narrow border. These panels are exceptionally suited for multi-display applications.

The BRILAN professional is characterized by optimum functionality and optimized for using primarily DID panels.

Green IT: Compared with matchable devices we have reduced power consumption of MAXLine by 40 to 50%. In standby mode our displays spend less than 2 Watts energy.

## VIDEO MODUL

BRILAN as a monitor for demanding requirements in all situations

The BRILAN video function module fulfills all requirements for a high-end display unit.

The controller used for this monitor features numerous convenient functions. Incoming video signals are automatically converted to graphic signals and adapted to the picture. It is possible to display two video sources next to each other. Also, Picture-in-Picture enables the simultaneous display of two video sources in any position. The depicted display is freely adjustable and swivel-mounted.

With Tiling an option is provided, which spreads an advertisement out to several monitors and it allows split screens in any combinations desired.

All available functions are controlled via RS 232 by means of special software, optionally by remote control.

## LAN MODUL

BRILAN as a controllable LAN monitor

The BRILAN Artista function module is a „fit for purpose“ solution for displaying static images. The LAN MODUL connects the monitor to an IP Ethernet network. It is PC-less and without operating system, requires no maintenance or administration and reduces the power consumption of the display controller to less than 2 Watts. One single server in the network can distribute individual content to an almost unlimited number of LAN monitors.

Various display drivers and software packages for displaying images or for playing slide shows are available as well as a SDK which allows an easy integration of the LAN monitors into existing applications. The ideal solution for ePoster displays.

## IQ MODUL

BRILAN as an intelligent display system with PC components

The BRILAN IQ function module is equipped with all the features of a modern PC system. The integration of modern PC components means that no additional computer hardware is necessary. Green Power is guaranteed due to the use of energy-saving Intel® Mobile Technology. This enables the space-saving display of CPU-bound processes, in addition to unusual customer requirements.

## OPEN MON

The intelligent concept for optimal flexibility

What is OPEN MON? - This concept provides a modular system. The customer selects the desired panel and design and then looks for a suitable function model to match his selection. Each unit is made up of a display module and a function module. PC integrated and yet separate? With OPEN MON the customer has both. Attractive integration in the display, with no cable mess or installation problems. To exchange components, simply loosen two screws and pull out the module. Because OPEN MON utilizes plug-in connections, which are optimized for the exchangeability of all function modules.
